

Exercise 4.4 *In this exercise a data on the abundance of worms in soil is studied. The total number of worms in samples of the same size of three different soils (termed "1", "2" and "3") was determined using two different methods (labelled "1" and "2"). The question is whether the abundance of worms differ for the three soil types and/or the determination method. The data-frame "Ex4.4" contains the data of this exercise.*
